

2 (short)

The pin jointed aluminium structure shown in Fig. 2 is composed of two members with cross sectional area A and Young's modulus E such that $L/(AE) = 10^{-6} \text{ N}^{-1} \text{ m}$. A vertical point load F is applied at joint A. Using graphical methods or otherwise, determine the horizontal and vertical displacement of joint A when the applied force $F = 1 \text{ kN}$. [10]
